

# Cassandra Tutorial

Jinlai Xu

# Prerequisites

- Java 8
  - `sudo update-alternatives --config java`
- Python 2.7 for CQL
  - `sudo apt-get install python2.7`

```
There are 3 choices for the alternative java (providing /usr/bin/java).

  Selection    Path                                          Priority  Status
-----
* 0           /usr/lib/jvm/java-8-oracle/jre/bin/java      1081     auto m
ode
  1           /usr/lib/jvm/java-7-oracle/jre/bin/java        1       manual
mode
  2           /usr/lib/jvm/java-8-openjdk-amd64/jre/bin/java 1081     manual
mode
  3           /usr/lib/jvm/java-8-oracle/jre/bin/java      1081     manual
mode

Press <enter> to keep the current choice[*], or type selection number: 0
```

# Install Cassandra (on all nodes) 3.11

- `echo "deb http://www.apache.org/dist/cassandra/debian 311x main" | sudo tee -a /etc/apt/sources.list.d/cassandra.sources.list`
- `curl https://www.apache.org/dist/cassandra/KEYS | sudo apt-key add -`
- `sudo apt-get update`
- `sudo apt-get install cassandra`

# Configure (on all nodes)

- nano /etc/cassandra/cassandra.yaml
- Edit the lines below (**red** denotes the changes):
  - - seeds: "**master, slave01**" (on all nodes)
  - listen\_address: **master** (on master node)
  - listen\_address: **slave01** (on slave01 node)
  - ...
  - rpc\_address: **master** (on master node)
  - rpc\_address : **slave01** (on slave01 node)
  - ...

# Start the services ( on all the nodes)

- Firstly, stop the Cassandra service:
  - `service cassandra stop`
- Then, start the Cassandra process manually to monitor the service status and logs:
  - `cassandra -Rf`

# Start CQL client

- Initial a new terminal and log into one of the VM
- Use nodetool to see the Cassandra cluster's status
- nodetool status

```
Datacenter: datacenter1

```

- Start the CQL client
  - cqlsh master
  - OR cqlsh slave01 (because both nodes start the CQL service)

# CQL test

- `CREATE KEYSPACE patient WITH replication = {'class': 'SimpleStrategy', 'replication_factor' : 3};`
- `CREATE TABLE patient.exam (patient_id int, id int, date timeuuid, details text, PRIMARY KEY (patient_id, id));`
- `USE patient;`
- `INSERT INTO exam (patient_id,id,date,details) values (1,1,now(),'first exam patient 1');`
- `INSERT INTO exam (patient_id,id,date,details) values (1,2,now(),'second exam patient 1');`
- `INSERT INTO exam (patient_id,id,date,details) values (2,1,now(),'first exam patient 2');`
- `INSERT INTO exam (patient_id,id,date,details) values (3,1,now(),'first exam patient 3');`
- `select * from exam where patient_id=1;`

# FAQ

- How to solve the ERROR that the cluster name is not matched?
  - If you change the cluster name, you need to delete the storage directory for every nodes in “/var/lib/cassandra/data”
